CONTENT AUTHENTICITY INITIATIVE

Provenance refers to the basic, trustworthy facts about the origins of a piece of digital content (image, video, audio recording, document).

Provenance: The records describing the possession of, and changes to, components, component processes, information, systems, organization, and organizational processes. Provenance enables all changes to the baselines of components, component processes, information, systems, organizations, and organizational processes, to be reported to specific actors, functions, locales, or activities.

Coalition for Content Provenance and Authenticity (C2PA)

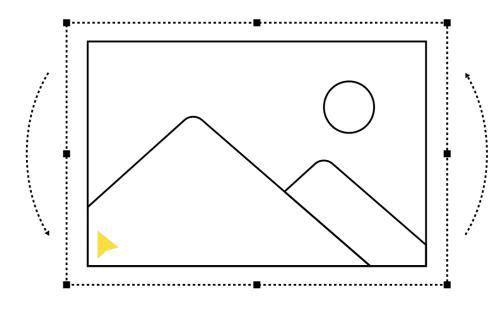

https://c2pa.org/

1-CREATE

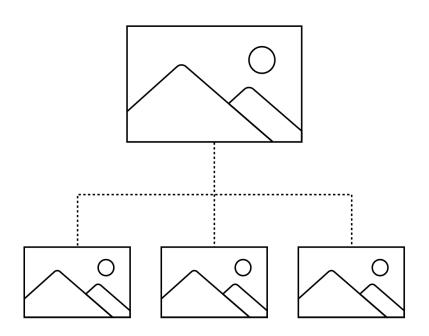

We use cryptographic asset hashing to provide verifiable, tamper-evident signatures that the image and metadata hasn't been unknowingly altered. At creation, choose what information to attach to the content being created. Throughout this process, the creator of content can choose to preserve attribution or to remain anonymous. Privacy and security of photojournalists and other creators are of the utmost consideration in our work.

2-EDITING

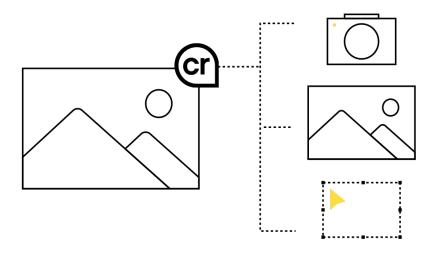

Using tools like Photoshop, secure capture metadata will be preserved and amended with history data of any alterations to content.

3-PUBLISHING AND SHARING

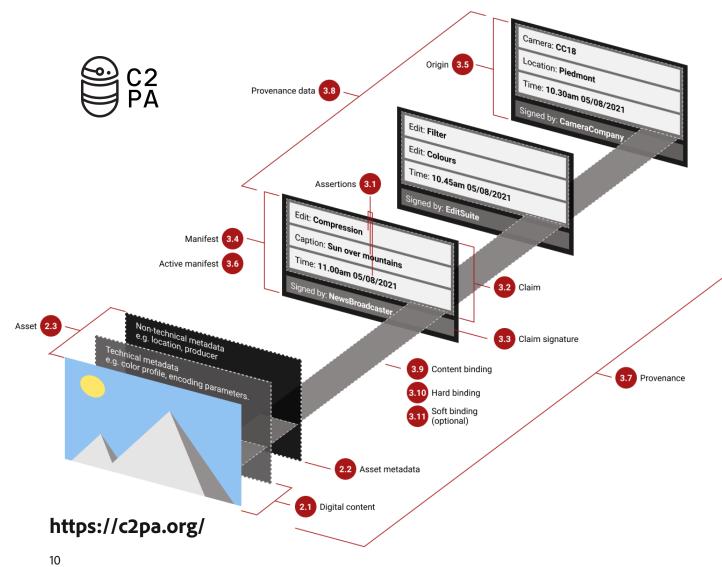

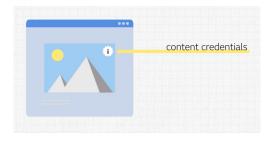

Through partnerships with news organizations, see secure capture information and any relevant content edits preserved through the publishing process, through integration with publishers' CMS. When content is shared on social networks, the product flow will preserve CAI metadata.

4-VIEWING

As a consumer of digital content, anyone can view historical information about content with CAI metadata through the <u>Verify</u> site.

Permanently binding provenance securely to media involves:

Assertions - What was done to an image, by whom, when etc.

Manifest - Package of assertions, asset hashes & signatures

Asset Bindings -

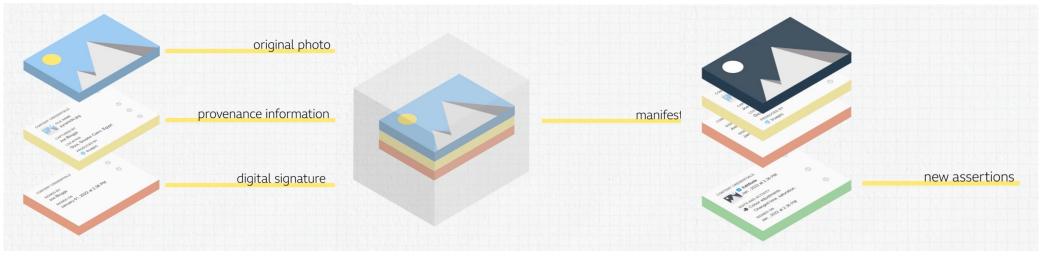

Cryptographically connect manifests to media and support recovery

<u>Provenance</u> – chain(s) of Manifests

<u>Verification</u> – protocol for ensuring nothing has been altered

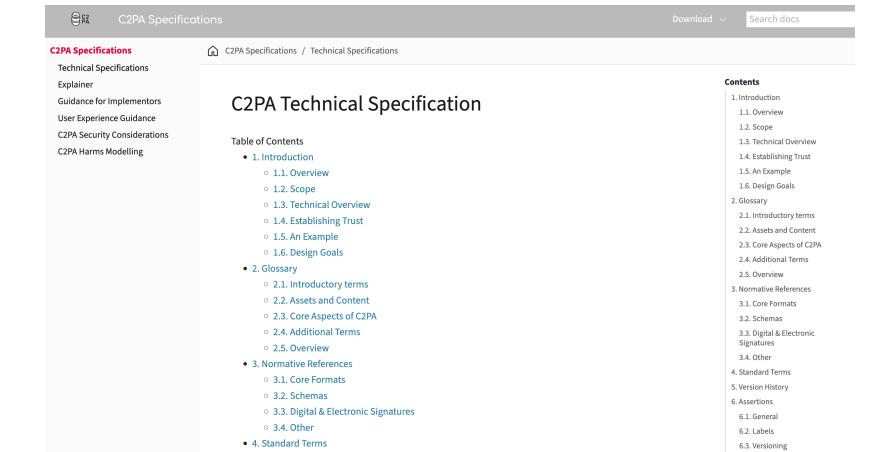

COALITION FOR CONTENT PROVENANCE AND AUTHENTICITY (C2PA)

https://c2pa.org/

Signing C2PA manifests requires an endentity certificate that complies with the C2PA Trust Model. C2PA follows the Public Key Infrastructure (PKI) using your private key and public certificates in the signing process.

C2PA Specifications

C2PA Specifications

The Coalition for Content Provenance and Authenticity (C2PA) addresses the prevalence of misleading information online through the development of technical standards for certifying the source and history (or provenance) of media content. C2PA is a Joint Development Foundation project, formed through an alliance between Adobe, Arm, Intel, Microsoft and Truepic.

This site contains the various specifications and documents produced by the C2PA.

- Technical Specifications
- Explainer
- Guidance for Implementers
- User Experience Guidance
- Security Considerations
- Harms Modelling
- Guidance for Artificial Intelligence and Machine Learning

PDF Versions of these documents are also available via the Download button in the page header.

Official Content Credentials "<u>icon of transparency</u>," a symbol that will become the ultimate signal of transparency in digital content.

https://contentcredentials.org/

ICON OF TRANSPARENCY

Truly Open Standards

Content Credentials are based on an open technical specification developed and maintained by the C2PA, a cross-industry standards development organization. You can review the specification anytime.

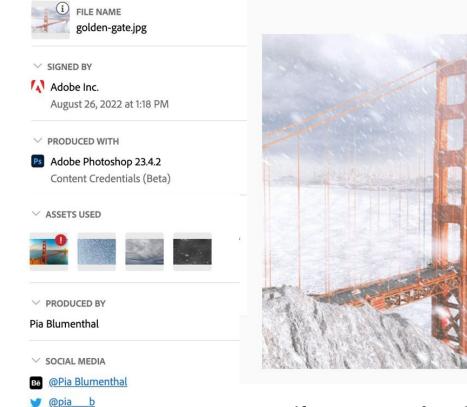

Clear Tampering Detection

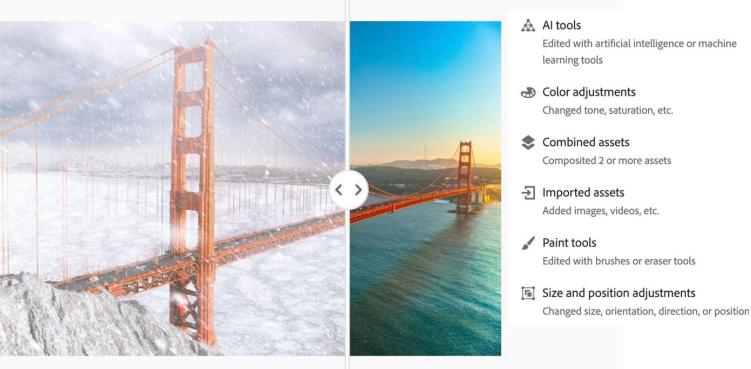

Content Credentials use technology that makes it clear if content has been altered since its Content Credentials were created. Up-to-date context travels with the content, wherever it goes.

Accountability

Devices, software, and organizations that issue Content Credentials identify themselves in the Content Credentials they issue. Issuers therefore stake their reputations on their ability to record information accurately.

THIS IS WHERE WE WANT CAI CONTENT CREDENTIALS

- Provenance starts at the sensor
- But we also have synthetic media—
 Provenance starts at creations includes
 training data, 3d objects or other sources
- What about the metaverse?
 —can CAI be used in a virtual world
